IOAN-GHEORGHE ROTARU
DENISE ELAINE BURRILL

The attempt to apprehend the components of a society as an intimate ecosystem has reached new dimensions due to the impact of science and technology over the new mechanisms of socialization, urbanization, and globalization. This impact shifted the social paradigms in unanticipated directions, as the new relationships are now increasingly determined by a clinical separation by lines of networks of professional interests, hobbies, beliefs, sports, politics, and cultural passions. At the same time, new puzzles triggered by the empirical realities of the physical world, in concert with spiritual consciousness and cultural meaning, seem to propose a new convergence of variables meant to promote a unified worldview.
